

Date: 09/14/26

Time: 3:10 - 3:25

Location: Virtual meeting

Team members present: Joseph, Alexander, Tram, Umair Waleed, Rahul Nesan, Niles, Dhruvi Dharmeshbhai

Tasks allocated/completion:

- **Initial UI and cell states** (estimated completion time: 1 hour) 
 - Create a minesweeper grid and label columns and rows
 - Create cell states like **cell.is_mine**, **cell.is_uncovered**, and **cell.is_flagged**, and the cell counter called **cell.adjacent_mines**

Author: Joseph, Date: 9/15, Actual completion time: 1 hour

- **Game status and mines remaining** (estimated completion time: 1 hour) 
 - Print the player's status while playing the game. Change upon uncovering a mine, or uncovering all cells without a mine
 - Print the remaining amount of mines. Referring to the number of flags placed on a cell that could or could not have mines.

Author: Joseph, Date: 9/15, Actual completion time: 1.5 hour

- **Mine configuration** (estimated completion time: [number of hours])
 - Prompt the user for the desired mine count (10-20)
 - Randomly place the mines on the grid

Author: [name], Date: [month/day], Actual completion time: [number of hours | example: 1.5 hours]

- **Adjacent mine counter** (estimated completion time: [number of hours])
 - Update the **cell.adjacent_mines** for each cell near a **cell.is_mine** cell. Try adding a function within the mine configuration code and select the adjacent 2D indices to increase the **cell.adjacent_mines** value.

Author: [name], Date: [month/day], Actual completion time: [number of hours | example: 1.5 hours]

- **Add Uncover function** (estimated completion time: [number of hours])

- Create the **uncover_cell** function for the user and for other functions to use

Author: [name], Date: [month/day], Actual completion time: [number of hours | example: 1.5 hours]

- Add the player's first safe-uncovered cell and the auto-uncovered adjacent cells (estimated completion time: [number of hours])
 - Add the player's first safe-uncovered cell (so place the mines after the player's first selected cell to uncover)
 - Add the feature where the game uncovers adjacent cells. Check if the adjacent cell has the **cell.adjacent_mines** value as zero; if so, uncover until you encounter a neighboring cell with a **cell.adjacent_mines** value not equal to zero.

Author: [name], actual completion time: [number of hours | example: 1.5 hours]

- Add Flag function (estimated completion time: [number of hours])
 - Create the flag function for the user
 - Allow the same flag function to unflag a cell
 - Prevent uncovering a cell that is currently flagged

Author: [name], Date: [month/day], Actual completion time: [number of hours | example: 1.5 hours]

- Add player input and main game loop (estimated completion time: [number of hours])
 - Define an input string format for the player
 - Ex. A4, Flag **OR** Flag, A4
 - Format and run the player's command
 - Add the main loop and end the program once the player wins or loses
 - Show the mine locations when the player loses

Author: [name], Date: [month/day], Actual completion time: [number of hours | example: 1.5 hours]

Notes: We decided to make a list of tasks to complete for the project. Each member will choose a task to complete and commit to a main branch. I (Joseph) will debug any problems at the end of every day so people keep up to date on the latest branch.
